

Supplemental Fig. 1. Additional comparisons of 35 patients with chronic kidney disease (CKD) with 400 normotensive subjects and 253 medicated hypertensive patients: supine pulse wave velocity (A); supine and upright aortic characteristic impedance (B) and subendocardial viability ratio (C); the analyses were adjusted for age, sex, body mass index, low-density lipoprotein cholesterol, atherogenic index of plasma, and presence of diabetes; analyses of pulse wave velocity were additionally adjusted for mean aortic pressure; repeated measures analysis of variances with the Bonferroni correction in post-hoc analyses, means (95 % confidence intervals), * $p < 0.05$.
