

Supplementary Figure 7

Supplementary Fig 7. Neutropenic mice display enhanced susceptibility to *A. fumigatus* challenge.

wt or *Clec7a*^{-/-} mice were challenged with 1×10^6 conidia of *A. fumigatus* and survival was monitored daily. Neutropenia was induced by anti-Ly6G antibody administration and confirmed by phenotyping in blood (neutrophils were considered CD45⁺CD11b⁺Gr-1⁺CCR2⁻ to avoid the use of Ly6G-targeted antibody for phenotyping). Antibody-mediated neutrophil depletion scheme, *upper panel*. Survival plot, *lower panel*. Unpaired t-test: Log-Rank test: * $p < 0.05$. $N = 10-11$ animals/group.
