

Supplemental Figure 2. Adjusted means and 95% CI for gait speed (m/s) by eGFR and UACR categories

Adjusted means and 95% confidence intervals for gait speed (m/s) for each category of eGFR (A) and UACR (B). Co-variables include age, gender, race, BMI, smoking status, and drinking status, coronary artery disease, congestive heart failure, peripheral vascular disease, arthritis, low back pain, depression, SBP, DBP and orthostatic hypotension. In addition, UACR was included in the eGFR-based model and eGFR in the UACR-based model.
