Supplemental Figure 3. Adjusted means and 95% CI for Falls Efficacy Scale (FES) score by eGFR and UACR categories.

Adjusted means and 95% confidence intervals for FES score for each category of eGFR (A) and UACR (B). Co-variates include age, gender, race, BMI, smoking status, and drinking status, coronary artery disease, congestive heart failure, peripheral vascular disease, arthritis, low back pain, depression, SBP, DBP and orthostatic hypotension. In addition, UACR was included in the eGFR-based modal and eGFR in the UACR-based model.
