Supplementary Figure. Comparison of minor allele frequencies for *LPA* markers between European-American and African-American samples. The numbers on the X-axis represent the minor allele frequency observed in the African-American sample (n=24). The numbers on the Y-axis represent the minor allele frequency observed in the European-American sample (n=23). A total of 275 SNPs, represented by circles, were compared between the two samples. The number of circles on the graph does not equal the number of total *LPA* SNPs because many SNPs have the same estimated minor allele frequency.
