

Supplementary Figure 1.

Ethidium bromide-stained gel for *N. n. orientalis* genomic DNA digested with *Apa*I (right lane). The most prominent DNA band in the *Apa*I-digest (arrowhead) was used for molecular cloning of repetitive sequences. A mixture of *Hind*III-digested λ phage DNA and *Hae*III-digested ϕ X174 phage DNA was used as a molecular size marker (left lane).
