

Supplementary figure 2. Histopathology of the liver of wild-type, *gzmA*^{-/-}, *gzMB*^{-/-} and *gzMAxB*^{-/-} mice 48h after infection with *K. pneumoniae*. Mice were infected with 4*10³ CFU *K. pneumoniae* intranasally. Semi-quantitative histology scores of interstitial inflammation (a), percentage of hepatocellular necrosis (b) and number of thrombi (c) are represented. Data are box-and-whisker diagrams depicting the smallest observation, lower quartile, median, upper quartile and largest observation. N = 7-8 per group.
