Joshee A [23]	2021	127	7	9	214	123	11	1	222	102	32	0	223

Supplementary figure 1: Showing the relation between specificity reported by a study with percentage of benign FNAB having histopathology report in the same study. Studies with low % of FNAB with histological correlation (left side of the graphs also show a low specificity.

**Relation between proportion of cases having histological follow up and specificity**

**Relation between proportion of cases having histological follow up and specificity**

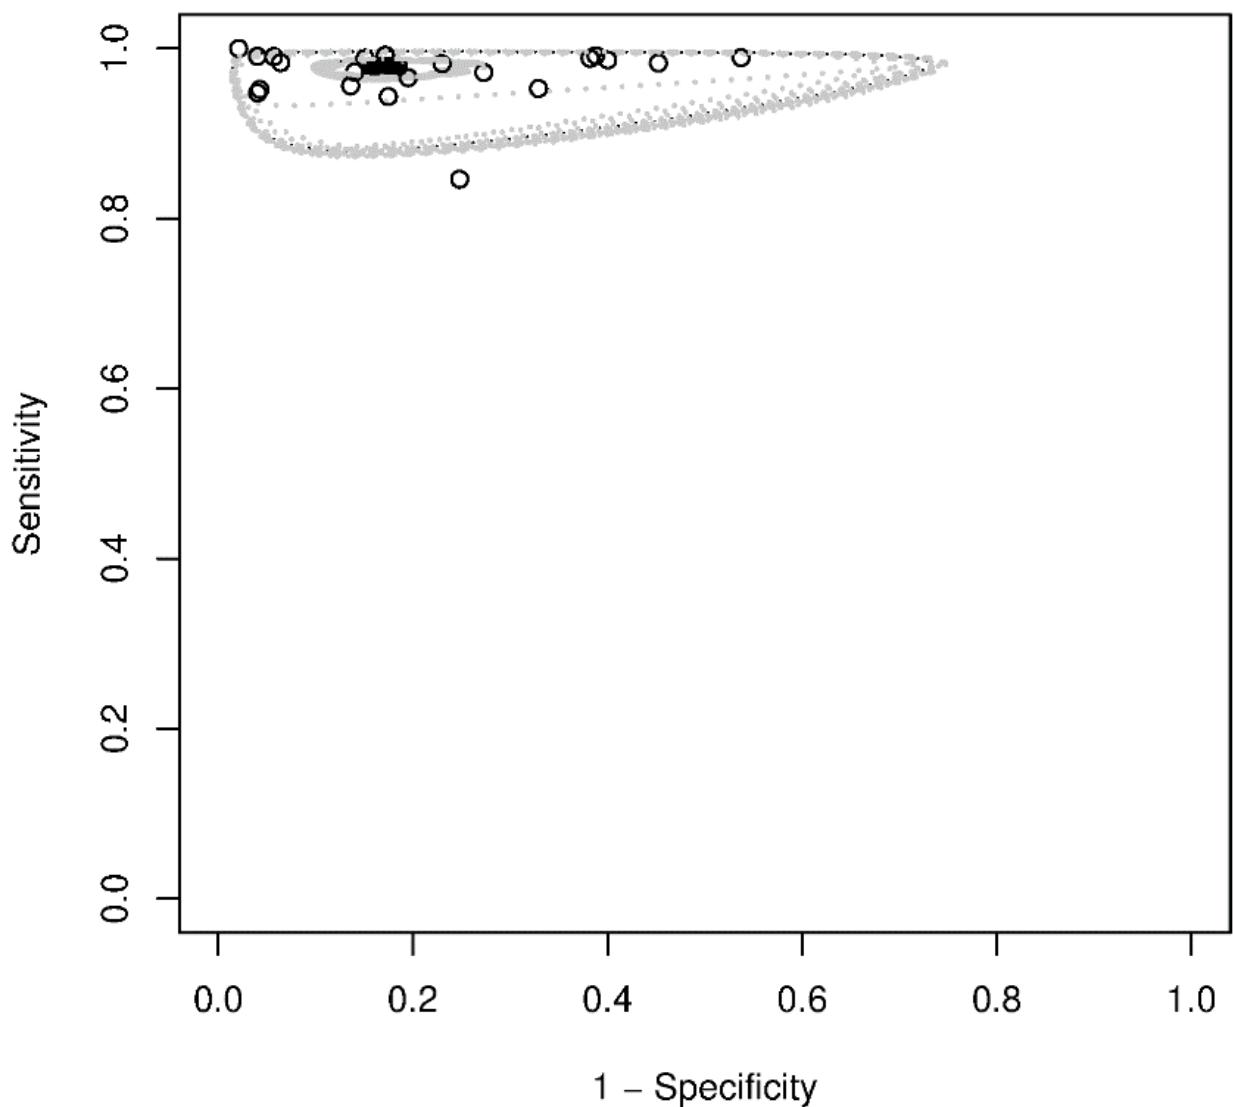

Supplementary table 3: Showing the parameters estimated by the Bivariate models for meta-analysis of the diagnostic accuracy of FNAB at Atypical, Suspicious and Malignant thresholds

Threshold	Parameter	Estimate	Lower 95% CI	Upper 95% CI
Atypical Considered positive	Logit Sens	3.813	3.416	4.210
	Logit Spec	1.601	1.153	2.049
	Sensitivity	0.978	0.968	0.985
	Specificity	0.832	0.760	0.886
	FPR	0.168	0.114	0.240
	DOR	224.576	126.193	399.660
	LR+	5.830	4.018	8.457
	LR-	0.026	0.018	0.038
	Correlation	-0.097		
	Theta	1.638		
	Lambda	5.929		
	beta	0.376		
	sigma2_theta	0.410		
	sigma2_alpha	1.348		
Suspicious Considered positive	Logit Sens	2.392	2.113	2.672
	Logit Spec	4.065	3.485	4.645
	Sensitivity	0.916	0.892	0.935
	Specificity	0.983	0.970	0.990
	FPR	0.017	0.010	0.030

Joshee A	0.976	0.961	0.985	0.851	0.996
None	0.975	0.962	0.984	0.859	0.996

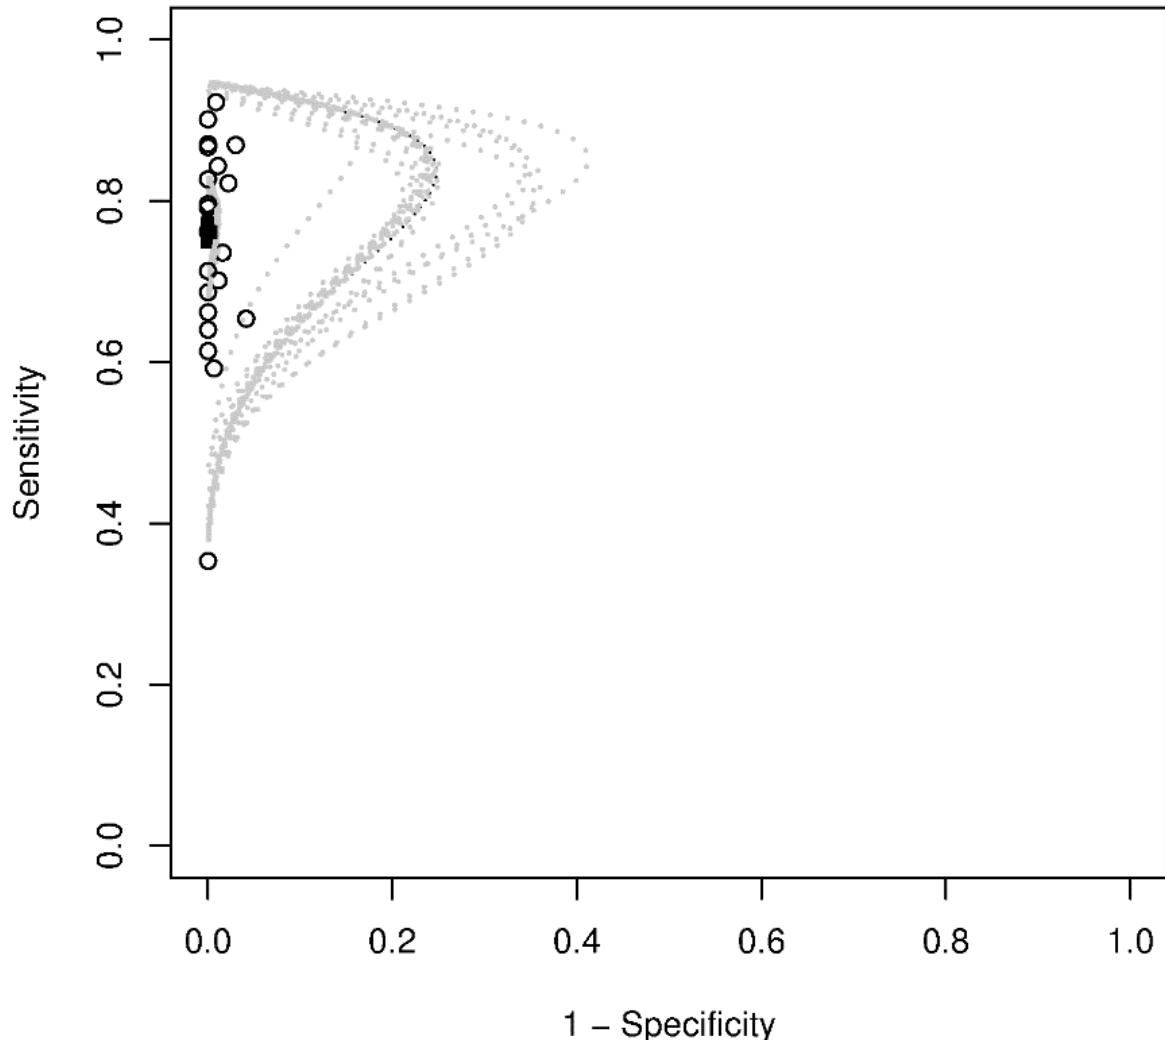

Supplementary Figure 2a: Graphical representation of the leave one out meta-analysis for the sensitivity and specificity for the analysis considering the Atypical category as positive for malignancy. All bivariate plots of 22 analyses leaving one study out have been represented on top of the other. The solid gray lines enclose the 95% Confidence Interval, the dotted lines enclose the 95% predictive intervals. All the solid gray lines from 22 leave one out analyses overlaid on the same plot shows little variation, but the 95% prediction areas do show variation especially for one study, which on further examination had a low load of FNAB performed per year.

Supplementary Figure 2b: Graphical representation of the leave one out meta-analysis for the sensitivity and specificity for the analysis considering the Suspicious category as positive for malignancy. All bivariate plots of 22 analyses leaving one study out have been represented on top of the other. The solid gray lines enclose the 95% Confidence Interval, the dotted lines enclose the 95% predictive intervals. All the solid gray lines from 22 leave one out analyses overlaid on the same plot shows little variation, but the 95% prediction areas do show variation especially for two studies, both of which had low load of FNAB performed per year.

Supplementary Figure 2c: Graphical representation of the leave one out meta-analysis for the sensitivity and specificity for the analysis considering the Suspicious category as positive for malignancy. All bivariate plots of 22 analyses leaving one study out have been represented one on top of the other. The solid gray lines enclose the 95% Confidence Interval, the dotted lines enclose the 95% predictive intervals. All the solid gray lines from 22 leave one out analyses overlaid on the same plot shows little variation, but the 95% prediction areas do show variation.

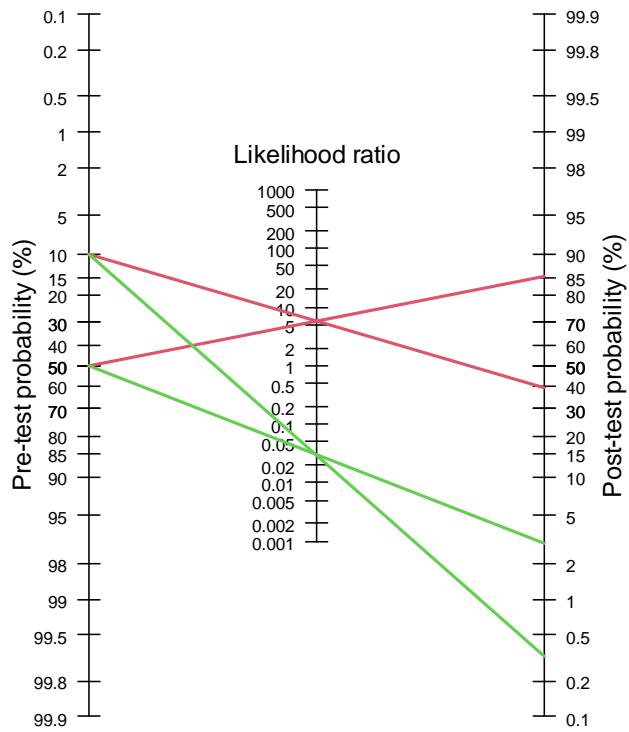

Supplementary table 5: Sensitivity analysis of the meta-analysis for the different thresholds excluding studies whose likelihood ratios differ markedly from the meta-analytic estimate of the likelihood ratios (as shown in Fig 5 of the main manuscript)

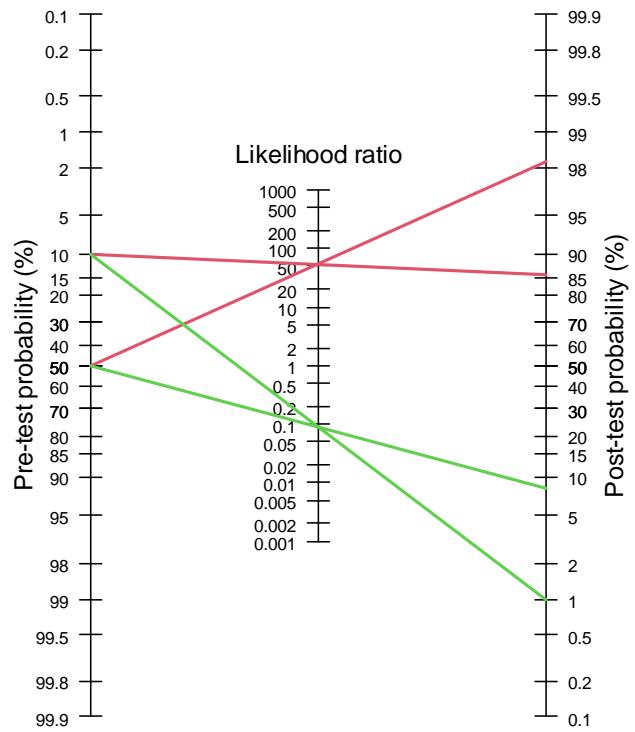

Threshold	Studies excluded	Sensitivity	95% CI	Specificity	95% CI
<b>Atypical considered positive</b>	McHugh KE, 2019 Wong YP, 2021 & Sarangi S, 2021	0.979 0.977	[ 0.972, 0.985] [ 0.966, 0.984]	0.836 0.811	[ 0.761, 0.890] [ 0.734, 0.870]
<b>Suspicious considered positive</b>	Chauhan V, 2019 McHugh KE, 2019	0.912 0.919	[ 0.888, 0.931] [ 0.896, 0.937]	0.982 0.985	[ 0.969, 0.990] [ 0.974, 0.991]
<b>Malignant considered positive</b>	McHugh KE, 2019	0.767	[ 0.709, 0.816]	0.999	[ 0.995, 1.000]

Supplementary figure 3: Showing Fagan nomograms with estimation of the post-test probability when testing at a pre-test probability of 10% and 50% for the three different diagnostic cut-offs

Fagan - Nomogram for cut-off Atypical considered positive

Fagan - Nomogram for cut-off Suspicious considered positive

Fagan - Nomogram for cut-off Malignant considered positive
